

Artificial Intelligence Overview

Artificial intelligence (AI) is intelligence demonstrated by machines.

AI was founded as an academic discipline in 1956.

Machine learning is a subset of AI that learns from data.

Deep learning uses neural networks with many layers.

Natural language processing allows machines to understand text.

Computer vision allows machines to interpret images.

The founder of modern AI is considered to be Alan Turing.

GPT models are large language models trained on internet text.

Reinforcement learning trains agents through reward and punishment.
